Type: ROUTINE INSPECTION  
Date: Feb-09-2016

2.40 (b) (2) REPEAT

### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

\*\*\*A female Maltese (#40) had build up on most of her teeth. There was a heavy build-up of yellowish brown to dark brown to gray material on the teeth. This abnormal build-up of material covered the majority of the teeth and extended into the gum line. Most of the gums were reddened and inflamed. There was a creamy, whitish material along the gum line. The abnormal build-up of material on the teeth can cause damage to the gum tissue and tooth structures. This can be painful, may decrease the dog's ability to eat normally and negatively impact the overall health of the animal. The licensee must have this animal's mouth and teeth examined in order to ensure that an accurate diagnosis is made and an appropriate dental treatment plan is developed and followed. The licensee must develop and establish an effective dental care program as part of the overall program of veterinary care for the animals in the facility. The licensee must ensure that all animals receive adequate veterinary care at all times.

Heavy  
Build  
up of  
yellow/  
brown/  
gray  
material  
on teeth.

Gums  
red &  
inflamed.

Creamy-  
whitish  
material  
along gum  
line.

Inspection and exit interview were conducted with the licensee, Erika Leisner VMO, and Chad Proctor AGI.

### 2.40 (b) (2) REPEAT

#### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

A male dog (#122) was occasionally licking its left rear foot. On closer observation, the inner pad on the left rear foot had a reddened, swollen pea size nodule on the side of the pad. The licensee was not aware of this dog's condition until it was pointed out. This dog's condition could be due to injury, infection and/or another veterinary medical condition which could be painful. The licensee must consult a licensed veterinarian about this dog, in order to ensure that an accurate diagnosis is obtained and an appropriate treatment plan is developed and followed. The licensee must ensure that all animals receive adequate veterinary care at all times.

INNER  
PAD OF  
FOOT -  
reddened  
nodule  
on side  
of pad.

The veterinary care for female Maltese (#40) from the 2/9/2016 inspection has been addressed. Inspection and exit interview were conducted with the licensee, Bill Heine ACI and Chad Proctor ACI.

### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

A female Pekinese (#83) was holding up her left rear leg while standing and favored the left rear leg while walking. On closer observation, the inner middle pad on the left rear foot was reddened and swollen. There was a lesion in the middle of this swollen pad that went the width of the swollen pad. The edges of the of the lesion had yellowish skin around the edges. The licensee stated he noticed this dog limping a week or two ago. When asked if this dog was receiving treatment the licensee replied "no" and also said had not contacted their veterinarian about this dog. This dog is currently not receiving treatment and is currently showing signs of discomfort. This dog's condition could be due to injury, infection and/or another veterinary medical condition which could be painful. The licensee must have this animal examined by a licensed veterinarian in order to ensure that an accurate diagnosis is obtained and an appropriate treatment plan is developed and followed. The licensee must ensure that all animals receive adequate veterinary care at all times.

To be corrected by: October 10, 2015.

### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

\*\*\*\*Two dogs had eye problems that needed to be seen by a veterinarian. The right eye of an adult, female English Bulldog named Sydnie (mic# OAO 1673800) had a cloudy cornea, redness in the conjunctiva, and a thick discharge from the eye. The right eye of an adult female English Bulldog named Valentine (mic# OAO 2021913) had a cloudy cornea and a thick white discharge. This dog has had ongoing problems for several months with that eye and responds to treatment, but the problems reoccur when treatment is stopped. The Attending Veterinarian told the licensee that eye may need surgery if problems continued but the licensee has not returned the dog to the veterinarian despite the reoccurring problems. Eye problems can be painful, can progress rapidly, and can result in loss of vision. The licensee must have these dogs examined by a veterinarian for diagnosis and treatment.

\*\*\*\*Two dogs had skin problems that needed to be seen by a veterinarian. An adult, male English Bulldog named Mr. Wuffles (mic# 900FCC5E3) had a 2 inch by 4 inch lesion on his face. This area had lost some hair and the skin was reddened and seemed greasy. The Attending Veterinarian had examined this dog on 5/23/15 and noted skin problems at that time. Her recommendation was to treat the dog with chlorhexidine and cephalexin when these conditions occurred. The dog was currently being treated with only chlorhexidine and did not seem to be improving. An adult, female English Bulldog named Krispy Krems (mic# OAO 1873967) had a 6 inch in diameter area over her rump that was missing some hair and had red, greasy skin. The licensee was treating the lesion with only iodine. Skin problems can be painful and can be an indication of an underlying medical condition. The licensee must have these dogs examined and treated by a veterinarian.

TO BE CORRECTED BY FEBRUARY 2, 2016.

The inspection and the exit briefing were conducted with the licensee and with Cassie Driskill, an inspector with the MO Dept of Agriculture.

2.40 (b) (2)

### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

There is a female ShihTzu #218 that has an injured left eye that is dark red in color and swollen and very bloodshot in the throughout the white of the eye, and in the center of the eyeball. There is a small circular protrusion in the center of the eye that could be a tear or possible puncture that could be the source of the injury or result. This is possibly a recent injury and had not been observed by the licensee until the inspection, and has not been treated. This same female had a large buildup of brown material on her teeth with swollen and red gums due to inflammation. There were 2 areas on the gums where they were bleeding slightly around two teeth due to inflammation.

It is important that all injuries are identified as soon as possible and proper diagnosis and treatment is provided to decrease the pain or discomfort to the animal.

The licensee needs to contact the attending veterinarian for proper diagnosis and treatment of the eye.

To be corrected by: July 9, 2015

The licensee put a call out to the attending veterinarian by the end of the inspection.

Inspection and exit interview conducted with licensee.

### 3.1 (c) (3)

#### HOUSING FACILITIES, GENERAL.

- There is a mixture of dirt, grease and other excreta on one fiberglass wall board. One dog is in contact with the affected wall board located in sheltered housing. The affected area covers approximately 30 to 40 percent of the total wall surface. It indicates an unsanitary living condition exists that could lead to potential disease or health risks. Spot cleaning daily and sanitization of all surfaces is necessary to prevent an accumulation of excreta and other disease hazards. The licensee must ensure that all surfaces are spot-cleaned daily and sanitized at least once every two weeks or more often if needed in accordance with section 3.11 B. Correct by 5/20/15.

dirt, grease  
Excreta  
covers  
30-40%  
of  
wallboard  
in  
enclosure

### 3.11 (c)

#### CLEANING, SANITIZATION, HOUSEKEEPING, AND PEST CONTROL.

- There is an overgrowth of weeds around one sheltered building housing 10 dogs. The weeds were estimated to be four to five feet in height. This could provide a living area for rodents, other pests or vermin. The licensee must control all weeds so as to facilitate cleaning of the premise and pest control and to protect the health and well-being of the dogs. Correct by 5/26/15.

Overgrowth  
of weeds  
(4-5 ft.  
high.)

- Cobwebs and dust were observed collecting on top of wood one by sixes, chicken wire fencing and heat lamp protectors in three enclosures. The affected areas are located in the west sheltered building housing six dogs. It indicates unsanitary living conditions exist that could impact the health and well-being of the dogs. It indicates a potential living area exists for other pests. The licensee must ensure all areas of the facility are kept clean to facilitate normal husbandry practices and to protect the health and well-being of the dogs. Correct by 5/26/15.
- The facility inspection and verbal exit briefing done on 5/12/15 were conducted with the licensee.
- Copy of the inspection report was sent by certified and regular mail.

Cobwebs  
& dust  
accumulated  
in  
enclosures

2.40 (b) (2)

### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

\* One adult gray and white male named Darla ( number 04-1) and one adult blue and white male named Bandit ( number 507) were observed to have an abnormal, goose step appearing gait. The licensee stated that both Shih Zue / Bichon cross dogs were approximately two years in age. When walking no bend or flex to the back legs of both dogs were observed. In addition, the back legs of both dogs would extend straight forward and outwards when attempting to walk. Each dog would elevate one of their back legs and place no weight on it when they stopped walking. When resting the elevated back leg would extend forward to an estimated 45 degree angle and stay that way until they started walking. The licensee stated that both dogs were born with this abnormal gait from a powder she applied to both dogs' dams. The attending veterinarian had not been consulted nor had any treatment been provided at the time of inspection. Foot problems can be painful causing discomfort when the dog has to place weight on the affected foot. It can affect the mobility and daily activity of this dog. The licensee must have both animals examined by a veterinarian and appropriate treatment plan administered. The outcome of this examination must be documented and provided to the inspector upon request. The licensee must ensure that all animals receive adequate veterinary care at all times. Correct by 6/2/16.

Abnormal /  
"goose step"  
appearing  
gait on  
Two  
Dogs.  
No bend  
or flex  
when  
walking.  
Back legs  
extend  
forwards  
& outwards  
when  
attempting  
to walk.

3.1 (c) (1) (ii)

### HOUSING FACILITIES, GENERAL.

\* A sheet of tin with a horizontal tear estimated to be four inches in length was observed along the lower right hand of one enclosure. The tear was jagged and sharp in appearance and was turned outwards towards the dogs. Three dogs are in contact with the affected area which is located on the west outside wall of the east sheltered building. Jagged edges with sharp points could cause potential injury. The licensee must ensure all surfaces are free of any jagged edges or sharp points that might injure the animals. Correct by 6/2/16.

Type: ROUTINE INSPECTION

Date: Feb-18-2015

2.40

(b) (2)

REPEAT

### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

- In the sheltered facility, "Ziggy," an 8 year old dappled Dachshund male (ID # 0A01705230 ) had an excessive buildup of a dark brown material on the teeth extending up into the gum line. Most of the teeth could not be visualized. The gums were swollen and reddened. There was a yellow, creamy material along the gum line near one of the large cheek teeth on the right side (the large carnassial tooth). The buildup of abnormal material on teeth with a discharge at the gum line can be painful, impact the ability of the dog to eat normally, and harm the health of the animal. The licensee must have this animal examined by a veterinarian to obtain an accurate diagnosis and appropriate treatment plan. The outcome of this consultation must be documented and provided to the inspector upon request. The licensee must ensure that all animals receive adequate veterinary care at all times.

- In the sheltered portion located behind the licensee's home a red female Chow Chow named, "Pearl" had a clear discharge surrounding and draining from both eyes and down her face. The discharge completely circled each eye and ran down her face toward the muzzle. The licensee stated that Pearl's eyes had been that way since she was a puppy but no documentation could be provided from the attending veterinarian indicating a pre-existing condition. Eye discharge can occur due to infection, allergies, injury, irritation or other medical conditions that could be painful. The licensee must have this animal examined by a veterinarian to obtain an accurate diagnosis and appropriate treatment plan. The outcome of this consultation must be documented and provided to the inspector upon request. The licensee must ensure that all animals receive adequate veterinary care at all times.

- One outdoor enclosure contained three adult Scottish Terriers, two females and one male. One black female named, "Teddy Bear" appeared to be very sore and stiff when trying to walk. This could be an indication of an altercation between one or more of the other dogs in the enclosure or be an indication of health issues. Teddy Bear also had fecal material coating her bottom area indicating a quick release of feces associated with fear or intimidation from another dog or diarrhea. The stiff, sore posture indicates a health issue and the underlying cause must be determined and addressed. If the diagnosis is soreness due to fighting then the social hierarchy of this group does not accommodate these two particular females with this particular male. The licensee must take this animal to a veterinarian and determine the underlying problem and observe and establish appropriate compatibility between mating pairs in order to prevent future injury and maintain compatible groups at all times.

Excessive buildup of dark brown material on teeth. Most teeth cannot be visualized. discharge running from both eyes down the dog's face.

Type: ROUTINE INSPECTION

Date: Aug-06-2015

### 3.1 (a)

#### HOUSING FACILITIES, GENERAL.

At time of inspection all outdoor enclosures of the tan building housing twenty five adult dogs have holes dug in the dirt floor. The holes range in size from six inches to two feet in depth and a foot to three feet in circumference. Some of the holes are located next to the enclosure fencing between the pens. Some holes are dug back underneath the concrete allowing rough edges to be exposed. The holes are large enough that a dog could become entrapped if concrete cracks and collapses into the hole or if the dirt collapses. This affects the ability of enclosure flooring to contain the dogs securely. It could lead to potential injury if the dogs try to escape under the fencing or if material or dirt collapses affecting the safety and health of the dogs. The licensee must ensure all enclosure dirt flooring is kept in good repair to protect the dogs from injury and contain the dogs securely at all times. To be corrected by 09-30-15.

An exit interview was conducted by Cathy Niebruegge, ACI, Brittany Light, ACI, and facility representative.

### RECORDS: DEALERS AND EXHIBITORS.

- Official USDA dog on hand sheets (7005's) did not have a complete listing of all dogs on the premise. When the records and dogs at the facility do not match it makes the records incomplete. Complete and accurate records are needed to ensure each animal's identity can be known with certainty and to facilitate the ability to trace dogs. The licensee must maintain records which fully disclose all information concerning each dog in their possession. The licensee must maintain complete and accurate records of all dogs at all times at their facility.

Incomplete  
Records

Corrected by: 11 March 2015

3.11 (a)

### CLEANING, SANITIZATION, HOUSEKEEPING, AND PEST CONTROL.

- In the sheltered enclosure with concrete runs there was an excess buildup of animal waste covering 40-50% of the concrete runs and 5-10% of the indoor portion and bedding. The licensee stated that the solid waste had been removed four days prior to the inspection. Fecal waste buildup reduces available floor surface area that the dogs have access to. Animal waste collecting under and around dogs creates an unsanitary condition and could lead to potential disease or health risks for the dogs. The potential for increased insect and pest infestation exists when animal waste is not removed in a timely manner. The potential for respiratory problems exist when the dogs are subjected to the continual smell of animal waste that is collecting under and around them. Removal of animal waste from the runs and inside the sheltered facility must occur daily to prevent an excessive accumulation that could cause soiling of the dogs contained in the primary enclosures and to reduce disease hazards, insects, pests, and odors. The licensee must ensure that all excreta is removed from the primary enclosures on a daily basis.

Excessive  
buildup  
of  
Animal

### 2.40 (b) (2) REPEAT

#### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

\*\*\*\*A male red Poodle named Turner (MC# 101-605-060) has an accumulation of dark brown material coating the entire surface of the upper cheek teeth. Teeth and gum problems can be painful, can affect the animal's ability to eat, and can result in tooth loss. The licensee must have this dog examined by a veterinarian. The licensee must keep records of the diagnosis, treatment, and follow-up care and must make these records available to the inspector upon request. The licensee must establish an effective program of dental maintenance for all dogs in the kennel.

\*\*\*\*Three dogs, a red male Poodle (MC#101-605-060), a white male Bichon (MC#000-729-5417), and a male red Poodle (MC#096-782-377) all have matted hair on the legs, neck, shoulders and back covering at least 60 percent of the body. Matted hair can cause pain and discomfort, trap dirt, debris and moisture and affect the skin. It can foster skin infections, affect the animal's mobility or be able to defecate normally. Matted hair does not maintain the same insulating qualities of normally groomed hair. The licensee must remove all matted hair and establish an effective program for coat maintenance for the health and well-being of the dog.

The inspection and exit interview was done with facility representative.

Certificate: 73-A-2145  
Site: 001  
ALISON HAWKINS

Type: ROUTINE INSPECTION  
Date: Jan-29-2015

### 3.6 (a) (1)

#### PRIMARY ENCLOSURES.

On the south building the east side has a center washdown that is part of the structural strength of the kennel as the cages are attached to the washdown. There is a broken spot on the middle upright pipe where the washdown is broken loose. This has let the bottom row of cages sag down and the upper washdown is curved twisted with a lot of pressure on the plastic structure. This needs to be kept in good repair at all times.

This needs to be corrected to maintain the structural strength of the kennel and to protect the animals from injury.  
To be corrected by February 8 2015

Exit interview conducted with facility representative.

DIRECT NCI

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

DIRECT

\*\*\*An adult male chocolate Labrador retriever identification number 27 was shaking his head repeatedly. Upon examination, his left ear had a copious wet, watery brown discharge. The skin on the inside of the ear appeared inflamed and pink. The entire ear canal was wet, as well as the fur at the base and lower edge of the ear.

INDIRECT

\*\*\*An adult male yellow Labrador retriever identification number 55 has a scrape on the left side of his face near the temple. It is approximately 3/4 in. long and oozing blood. The top molars on both sides of the dog's mouth have a greyish-brown material covering the majority of the surface, and the gums above the upper molars and cheek teeth are reddened and swollen. The cheek teeth on both sides have a grey spongy-looking appearance at the base. The dog's body condition is slightly thin, with the ribs easily seen. His right ear on the inside base of the lobe of the ear near the canal has thickened skin that is hairless, pink, raw and moist-looking. This lesion is approximately 1 in. long and 1/4 in. wide.

Ear has thickened, raw skin.

Body condition thin, ribs easily seen.

\*\*\*An adult female brindle and white boxer identification number 34 was observed repeatedly licking her upper lip. Upon closer inspection, a thickened, pink, moist-looking lesion was seen. It is approximately 1/2 in. long and 1/4 in. wide. Her right ear also has a notch taken out of the tip that is about 1/4 in. in diameter. It is a fresh cut that was bleeding slightly.

Dog has lesion on lip.

These dogs have not been seen by a veterinarian.

Ear problems can be extremely painful and/or itchy, can cause other health issues and affect the well-being of the animal.

Skin wounds can be painful and lead to infection.

Mouth issues can be painful, make it difficult to eat, can lead to the development of other health

## Inspection Report

3.3 (c)

### SHELTERED HOUSING FACILITIES.

The sheltered housing facility lighting is too dim. There are several light bulbs that are not functioning properly, and there are not enough light fixtures for the size of the building. The inspectors had to use a flashlight on many occasions to better see the facility and animals.

Proper lighting is important for the daily observation of the animals, to ensure proper cleaning, and to facilitate the inspection process.

The licensee must ensure that all facilities are well-lit to aid in maintaining good housekeeping practices, adequate cleaning, inspection of the animals, and for the animal's well-being.

To be corrected by November 9, 2014.

3.11 (b) (2)

### CLEANING, SANITIZATION, HOUSEKEEPING, AND PEST CONTROL.

In the sheltered housing facility, the inside of a majority of the self-feeders have a brownish-black grime buildup that indicates they are not being cleaned and sanitized often enough.

Proper cleaning and sanitization of feeders kills disease pathogens that could affect the animal's health.

The licensee must ensure that all food receptacles are kept clean and are sanitized at least once every two weeks with a method prescribed in paragraph (b) (3) of this section, or as often as necessary to prevent a buildup of grime, debris, food waste, excreta, and other disease hazards.

To be corrected by October 11, 2014.

3.11 (b) (3)

### CLEANING, SANITIZATION, HOUSEKEEPING, AND PEST CONTROL.

All hard surfaces of the primary enclosures in the facility are not being sanitized often enough. The licensee stated that it is sanitized with detergents approximately once a month.

Sanitization of all hard surfaces in contact with the animals is important to kill pathogens and reduce disease hazards.

The licensee must ensure that all hard surfaces of primary enclosures and food and water receptacles are sanitized using either live steam under pressure, using hot water of at least 180 degrees Fahrenheit (82.2 degrees Celsius) and soap or detergent, or washing with detergent solutions and disinfectants or other products that accomplish the same purpose, with a thorough cleaning of the surfaces to remove all organic material and mineral buildup and to provide sanitization followed by a clean water rinse.

### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

- At the time of the inspection there was an 11 year old black female pug aka "Mattie" microchip number 0A02173973 that had bilateral ocular discharge and an abnormal gait. The facility representative stated she had not noticed her eyes or the abnormal gait. Mattie knuckled over on her left front foot when she walked. She also had bilateral ocular discharge. Her left eye appeared enlarged and the hair below the eye was caked with crusty material. The discharge from both eyes was yellow to green in color and thick in appearance. Gait abnormalities can be painful, may be due to underlying medical conditions and affect the health and well-being of this animal. Eye discharge can occur due to infection, allergies, injury, irritation or other medical conditions that could be painful.  
To be corrected by November 1, 2014.

- At the time of the inspection a female Japanese chin aka "Yoshi" microchip number 087817520 had a 2 week old puppy nursing and had an excessive buildup of a dark brown material on the teeth extending up into the gum line. Most of the teeth could not be visualized. The gums were swollen and reddened. There was a yellow creamy material along the gum line near one of the large cheek teeth on the right side (the large molar tooth). The buildup of abnormal material on teeth with a discharge at the gum line can be painful, impact the ability of the dog to eat normally, and harm the health of the animal.  
To be corrected by November 27, 2014.

- At the time of the inspection an 11 year old female Yorkshire terrier aka "Susie" microchip number 064027313 had most of her teeth removed prior to the inspection and her tongue protrudes out of her mouth. However, there was an excessive buildup of a dark brown material on the remaining teeth extending up to the gum line on the left rear lower molar. The gums in this area were reddened and swollen. The buildup of abnormal material on teeth with a discharge at the gum line can be painful, impact the ability of the dog to eat normally, and harm the health of the animal.  
To be corrected by November 10, 2014.

-- The licensee must have these animals examined by a veterinarian to obtain an accurate diagnosis and appropriate treatment plans. The outcome of these consultations must be documented and provided to the inspector upon request. The licensee must ensure that all animals receive adequate veterinary care at all times.

### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

- The contents of two 250 ml bottles of Safeguard labeled for use in goats is being used to treat the 68 dogs. This product is not labeled for use in dogs. This medication is intermingled with other products that are currently used at the facility and are therefore ready for use. When drugs not labeled for use on dogs are administered extra label, the results may not be known with certainty. The licensee must ensure that all drugs used as extra label have been approved by the attending veterinarian and dosage levels recorded on the bottle. The licensee must ensure that all drugs used to treat dogs have been approved for use by the attending veterinarian.  
To be correct by November 1, 2014.

for  
goats  
used  
to  
treat  
dogs

3.10

### WATERING.

- There were three of four water receptacles that had an algae looking substance in them in the main kennel building north of the house. The receptacles are located in the indoor portion of the enclosures. There are approximately 20 dogs drinking from these receptacles. The licensee stated that these receptacles were cleaned every 4 to 6 weeks. Contaminated water is no longer considered to be safe for the dog to drink and could lead to potential health risks. Algae and particulate material present indicates the lack of cleaning and sanitization which can prevent the water from becoming contaminated. The licensee must ensure all water receptacles are cleaned and sanitized once every two weeks or more often if needed for the health and well-being of the dogs.  
To be corrected by November 20, 2014

3.11 (d)

### CLEANING, SANITIZATION, HOUSEKEEPING, AND PEST CONTROL.

- At the time of the inspection there were rodent droppings accumulating on the floor concentrated around the edges in the vinyl building and as well as on the floor around the feed bin in the food storage building. Lack of an effective program that controls rodents can create unsanitary conditions and lead to potential spread of disease. There weren't any bait, traps, or other means to control or eliminate the rodents in these areas. The licensee must establish an effective program of rodent control and ensure all rodent droppings are removed from the kennel area for the health and well-being of the dogs.  
To be corrected by November 15, 2014.

### 2.40 (b) REPEAT

#### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

-In the outdoor hut type housing area there are four adult Chihuahuas, three females and one male, who have excessively long toe nails which need to be clipped. In the housing area under the open barn there is one adult female Chihuahua with excessively long toe nails which also need to be trimmed by the dealer. The dealer must groom and maintain the animals to protect their health and welfare and to protect them from injury.

Excessively  
Long  
toenails

### 2.40 (b) REPEAT DIRECT NCI

#### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

In the kennel facility there are a total of five animals which need to be evaluated by the attending veterinarian.

-In the outdoor housing area which contains hut type housing there are two adult dogs which need to be evaluated by the attending veterinarian. One animal is a ten year old Male Pomeranian, chip #051309259. The animal was first observed excessively salivating. Closer observation revealed the animal did not have any teeth and the jaw bone on the left side was partially missing and detached from the gums leaving the bone exposed. No health records available.

areas on its left shoulder and around its ear.

-In the same set but different enclosure there is a seven year old female Yorkshire terrier, non-readable chip, who had a circular white area in the center of her eye, white pupil. No health records available.

The dealer must maintain written documentation of the evaluation and all treatment.

### 3.6 (a) (1) REPEAT PRIMARY ENCLOSURES.

The kennel consists of multiple outdoor and one indoor housing area. In the southern most outdoor ground housing area there are five enclosures which have metal framing post which have portions that are broken with sharp points. These enclosures contain a total of nineteen adult dogs. In the whelping building there are raised wire bottom enclosures which line the north and south walls. And a row of hut type enclosures in the middle of the room. During the inspection there were six enclosures along the walls which have broken protruding wires. These raised enclosures contained a total of seven adults and sixteen puppies. All broken pipes and broken wires need to be repaired or replaced and maintained to protect the animals from injury and to protect their health and welfare.

Enclosures

metal  
framing  
w/  
sharp  
points  
Broken  
wires

### 3.11 (b) (1) REPEAT CLEANING, SANITIZATION, HOUSEKEEPING, AND PEST CONTROL.

The kennel consists of outdoor and indoor housing areas. Throughout the kennel there are enclosures whose food receptacles have a buildup of dark matter on their surfaces. One food receptacle is located in the hut type housing. In the whelping building there are eight enclosures containing a total of seven adults and thirty-two puppies. In the first set of outdoor ground enclosures there are seven receptacles which feed fourteen adult dogs. Which need to be cleaned and sanitized to protect the food from contamination, protect the health and welfare of the animals and facilitate husbandry practices.

Buildup of dark material  
on food receptacles.

### 3.11 (c) REPEAT CLEANING, SANITIZATION, HOUSEKEEPING, AND PEST CONTROL.

In the whelping building there are surfaces which need to be cleaned and maintained. There are accumulations of dirt, hair and / or dead insects and spider webs on the window seals, enclosure tops and divider panels. All premises including buildings and surrounding grounds must be kept clean and in good repair to protect the animals from injury, to facilitate husbandry practices and to eliminate breeding and living areas for rodents, pest and vermin to protect the health and welfare of the animals.

Affects thirty-three adults and ninety-one puppies.

Accumulation of dirt, hair, dead  
insects in enclosures.

Type: ROUTINE INSPECTION

Date: Apr-08-2014

### 3.1 (c) (1) (i)

#### HOUSING FACILITIES, GENERAL.

At time of inspection in building one pens one, three, and five pens on the south side, outside facility where Shebas are housed the last two pens at the south end, outside facility where the Corgies and Shebas are housed pens two, four and eight starting at the south end, and inside the big barn in one enclosure on the south side the metal base iron used to help support the enclosure gates and wire panels are showing excessive rust. An estimated three foot section of metal is rusted completely through on building one at the bottom of the gates. The other rusted metal base iron is at the bottom of the wire panels. Fifteen dogs are in contact with the affected support metal base. Excessive rust can erode and deteriorate all metal surfaces which affects the structural strength of the metal. In addition, the ability to protect the animals from injury could be questioned. The licensee must ensure that all metal surfaces are structurally sound, kept in good repair and must protect the animals from injury. To be corrected by 05-08-14.

Excessive  
rust in  
Enclosures

### 3.6 (a) (2) (i)

#### PRIMARY ENCLOSURES.

At time of inspection in Building Four the first and fifth pens on the west side had a broken and protruding wire. The broken wire in one pen was up closer to the top of the enclosure and the other broken wire was at the bottom of the enclosure. Four dogs are in contact or can come in contact with the affected wiring. Sharp points or edges could injure the dogs. The licensee must repair or replace all wire or wood surfaces to ensure the safety or health of the dogs. To be corrected by 04-20-14.

Enclosures  
Broken  
protruding  
wires

An exit interview was conducted with designated person of facility.

Date: Sep-11-2014

2.40 (b) (2)

### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

There is a female Boxer #89 that had an injury to her left eye resulting in pinkish/red tissue protruding from the center of the eyeball. This tissue was approximately a 1/4 inch in diameter and looked like a rupture or a growth coming out of the eye with some weeping. The dog appeared healthy and jumping around, however the injury or growth needs to be seen by a veterinarian. The issue had not been noticed by the licensee until during the inspection and the veterinarian was contacted after the inspection was complete.

There was a male Boxer #134 that had multiple lumps or growths on the outside of his right and left rear feet, and on the top and sides of his toes on his front feet. The lump on his right rear foot located on the outside toe was approximately 2 inches in length and 1/2 inch wide and deep, was very red and raw in appearance with some fluid around the sore. The other fleshy lumps were healed over, or older in appearance.

It is imperative that any injuries or growths are identified as soon as they occur and a veterinarian is contacted in order to decrease the time an issue can cause pain or discomfort for the animal, and in order to decrease the chances of a treatable injury from becoming a chronic or incurable health issue.

The licensee needs to contact the veterinarian for proper diagnosis and treatment as necessary as soon as health issues are identified.

To be corrected by: September 11, 2014

2.40 (b) (3)

### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

There is a female Boxer #89 that had an injury to her left eye resulting in pinkish/red tissue protruding from the center of the eyeball. The issue had not been noticed by the licensee until during the inspection and it is unclear if this is a new injury or if it is a growth that has been on the eye for some time.

There was a male Boxer #134 that had multiple lumps or growths on the outside of his right and left rear

feet, and on the top and sides of his toes on his front feet. The lump on his right rear foot located on the outside toe was approximately 2 inches in length and 1/2 inch wide and deep, was very red and raw in appearance with some fluid around the sore. The other fleshy lumps were healed over, or older in appearance. The licensee had not observed these lumps on the dog until during the inspection. The veterinarian was contacted in regards to both issues after the inspection was complete.

It is important that the regulated animals are observed daily for any signs of illness or injury in order to prevent a treatable issue from becoming chronic or causing any pain or discomfort for any longer time period than necessary.

The licensee needs to observe the animals daily to assess their health and well-being and that the veterinarian is contacted when issues are identified for proper diagnosis and treatment.

### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

\*\*\*\*\* A female Bullmastiff named Sally, ID#900108001281135, was lame and holding up her left front limb which appeared to have a reddened circular lesion on the bottom of the index pad. The toe nails on this foot are very short and the toe nails are recessed behind the pads. The foot appears compressed dorsal to plantar. This is an younger dog and the owner stated this was a longstanding condition of approximately 5 months. The animal was bright, active, and alert. This animal must be examined by a licensed veterinarian and health records must be maintained. Documentation must be maintained for any health related problems and it must include the following information:

- Identity of the animal.
- Descriptions of the illness or injury
- Dates, details, and results of examinations, tests, and other such procedures.
- Dates and other details of all treatments, including the name, dose, route, frequency, and duration of treatment with drugs or other medications.
- Follow-up exams to determine resolution of problem

### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

\*\*\*\*\* During the time of inspection, there was a 1000ml bottle of Safeguard cattle and sheep dewormer for use in parasite control. This medication did not have a prescription label or instructions for its use. If Safeguard is handled or administered improperly, it can be injurious or fatal to the animals and/ or owners and personnel. Adequate guidance to personnel must be provided to those who are involved in handling, dosing, and administering. The licensee was using medications not approved for use in dogs and not approved by the attending veterinarian. All medications not approved for use in dogs must be approved by the attending veterinarian and must be listed on the Program of Veterinary Care (PVC). The mixing instructions (if any), dosage, and directions for use must also be listed on the PVC.

\*\*\*\*\* The following medications were past the expiration date: Cephalexin 500 mg- expired 12/12 ,

## Inspection Report

Panacur 1000ml bottle- 08/13, Amoxicillin 500 mg expired 12/23/13, and an expired bottle of Metronidazole 250 mg. In addition there was a reconstituted brown bottle of an unknown substance without a label with no expiration date and no labeled dosage or directions for use. These medications were intermingled with other pharmaceuticals that are currently being used in the sheltered facility and are therefore ready for use. The licensee must ensure that all medications used in the facility are not expired and labeled properly in accordance with standard veterinary practices and manufacturer's recommendations.

### 3.6 (a) (2) (ii)

#### PRIMARY ENCLOSURES.

##### 3.6 (a) (2) (ii)

\*\*\*\*\*The heat lamps hung over the enclosure with 2 twelve week old Mastiff puppies did not have a wire guard to protect the puppies from thermal injury. One other enclosure with an adult female also had a heat lamp over the enclosure that did not have a wire guard. These heat lamps were hung approximately 3 feet off the floor and could be touched by the dogs. Enclosures must be constructed and maintained so that they protect dogs from injury.

This affects at least 3 animals.

Inspection and exit interview conducted with facility representative.

### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

\* One gray colored adult male Shih Tzu cross ( No Identification ) has matted hair on its back, hindquarters, face, ribs and rear legs covering approximately 80 percent of its body. The matted hair is balled and is tightly adhered to the skin. Matted hair can trap dirt, debris, and moisture and cause pain and discomfort. It can foster skin infections and hinder the animal's ability to move or defecate normally. Also, matted hair does not maintain the same insulating qualities of normally groomed hair. The licensee must remove all matted hair and establish an effective program for coat maintenance for the health and well-being of the dog. Correct by 12/2/14.

2.50 (a) (1)

### TIME AND METHOD OF IDENTIFICATION.

\* There are six dogs that have no official identification on them at time of inspection. The licensee is using collar identification on the dogs at the facility. Official identification is needed to ensure each animal's identity can be known with certainty and to facilitate the ability to trace dogs. The licensee must ensure that all dogs are officially identified by collar, tattoo or microchip means. If the licensee uses microchips then a microchip reader must be made available to the inspector at time of facility inspection. Correct by 12/18/14.

2.75 (a) (1)

### RECORDS: DEALERS AND EXHIBITORS.

\* Official USDA dog on hand sheets (7005's) had 18 dogs recorded, but there were 27 adult dogs counted by the inspector. When the records and dogs at the facility do not match it makes the records incomplete. Complete and accurate records are needed to ensure each animal's identity can be known with certainty and to facilitate the ability to trace dogs. The licensee must maintain complete and accurate records of all dogs at all times at their facility. Correct by 12/18/14.

\* The facility inspection done on 11/18/14 and exit briefing done on 11/19/14 were conducted with the licensee.
